3.2 To make patterns of shapes using different number of angles / types of angles

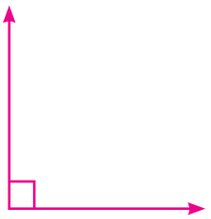

Let us recall the types of angles.

i) Zero angle equal to 0°

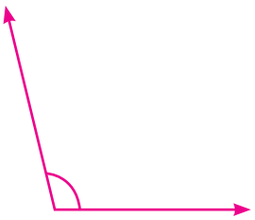

ii) Acute angle less than 90°

iii) Right angle equal to 90°

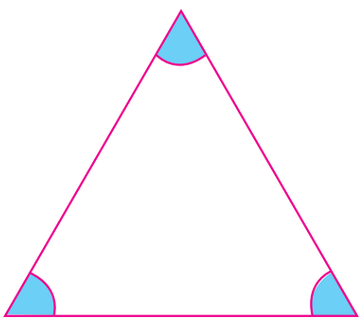

iv) Obtuse angle between 90° and 180°

v) Straight angle equal to 180°

Observe the angles formed at the vertex of the following shapes.

This is an equilateral triangle.

It has 3 angles formed at 3 vertices.

The 3 angles are equal in measure and they are equal to 60°.

It can be demonstrated as follows.

Straight angle

180°÷3=60°

60°+60°+60°=180°
