3 Fill in the blanks in the expressions with the suitable number.

(i) (1 x 9) = (□ x 1) (ii) (6 x 3) > (8 x □)

(iii) (36 ÷ 6) < (□ x 7) (iv) (0 + 2) > (7 x □)

(v) (42 ÷ 7) = (4 + □) (vi) (6 - □) < (1 + 2)

Using letters

Symbols are frequently used in mathematical writing. The use of symbols makes the writing very short. For example, using symbols, division of 63 by 9 gives us '7' can be written in short as "63 ÷ 9 = 7". It is also easier to grasp.

Letters can be used like symbols to make our writing short and simple

While adding, subtracting or carrying out other operations on numbers, you must have discovered many properties of the operations.

For example, what properties do you see in sums like (7 + 3), (3 + 7)?

The sum of any two numbers and the sum obtained by reversing the order of the two numbers and the sum obtained by reversing the order of the two numbers is the same.

Now see how much easier and faster it is to write this property using letters.

Let us use a and b to represent any two numbers. Their sum will be 'a + b'

Changing the order of those numbers will make the addition as 'b + a'. Therefore, the rule will be, for all values of 'a' and 'b'

(a + b) = (b + a).
