1 Digestive tract (Alimentary canal)

It is a coiled muscular tube extending from the mouth to the anus. It is about 6-9 metres long and consists of many specialized divisions. They are sequentially arranged as mouth, buccal cavity, pharynx, esophagus, stomach, small intestine, large intestine, rectum and anus.

Do you know?

There are some organisms which live in the digestive systems of animals. For example, tape worm lives in the human intestine.

2 Digestive glands

Three important digestive glands associated with the process of digestion are:

1. Salivary glands
2. Pancreas
3. Liver

Salivary glands secrete saliva which moistens food. Saliva contains enzymes which break down complex molecules into simple molecules. Pancreas produces pancreatic juice which contains digestive enzymes for digesting fats, proteins and carbohydrates. Liver produces bile for the digestion of fat.

Do you know?

The three pairs of salivary glands parotid, sublingual and submandibular gland secrete approximately 1.5 litres of saliva every day.
