Think

Do not put plastic garbage when you go near beaches. It is very dangerous for the aquatic life.

Sundar: Rani, Do you know that water continuously moves on, below and above the surface of the earth?

Rani: Really! How?

Sundar: There is a water cycle that occurs continuously. Water changes its state from solid, liquid, gas in this cycle.

The stages involved in a complete water cycle are:

Stage I: Evaporation - The heat of the sun falls on the water bodies like oceans, seas, lakes, rivers etc. The water slowly evaporates as vapours into the air.

Stage II: Condensation - As the vapours rise high, the cooler temperatures make them cool down and turn back into liquid. This is called condensation. Wind moves the liquid around, leading to the formation of clouds.
